Strata® Family of Adjustable Valves and Adjustment Systems – Innovative Technology for Hydrocephalus

Strata® valves are available in a wide range of configurations, providing convenience and flexibility for managing hydrocephalus patients.

The Strata family of adjustable valves includes the Strata Adjustable Valves, the Strata® NSC™ Adjustable Valves, and the Strata® NSC Lumboperitoneal Shunt Kit.

Benefits of the Strata Family of Adjustable Valves include:

- Simple, non-invasive performance level adjustments in the physician's office
- Easy for clinicians
- May decrease the need for revisions, reducing patient trauma and cost
- Multiple valve sizes and shunt configurations
- Strata valves with a Delta Chamber are designed to help maintain the equilibrium of cerebrospinal fluid (CSF) pressure, regardless of patient's body posture or flow control needs

Note: Strata valve products for Ventriculoperitoneal (VP) shunting may be adjusted and confirmed without the need for radiological confirmation. Strata Lumboperitoneal (LP) shunt products require radiological confirmation after valve adjustment.
